Treatments - Composites

12/09/2025 2:58 pm BST

Summary

Composite Treatments are a means of selling several items/services automatically when a trigger or 'Parent' item is dispensed in the Add Treatment screen.

This is a useful way to sell ‘Bundles’/'Packages' such as neutering procedures.

Composite Treatments are configured in Code Entry > Code Maintenance.

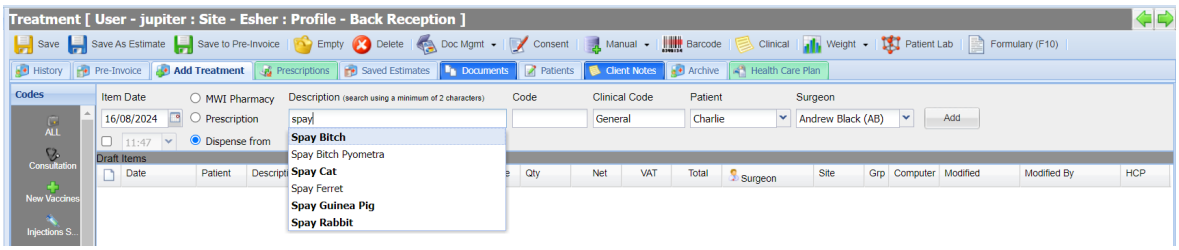

Details

Dispense a Composite Item

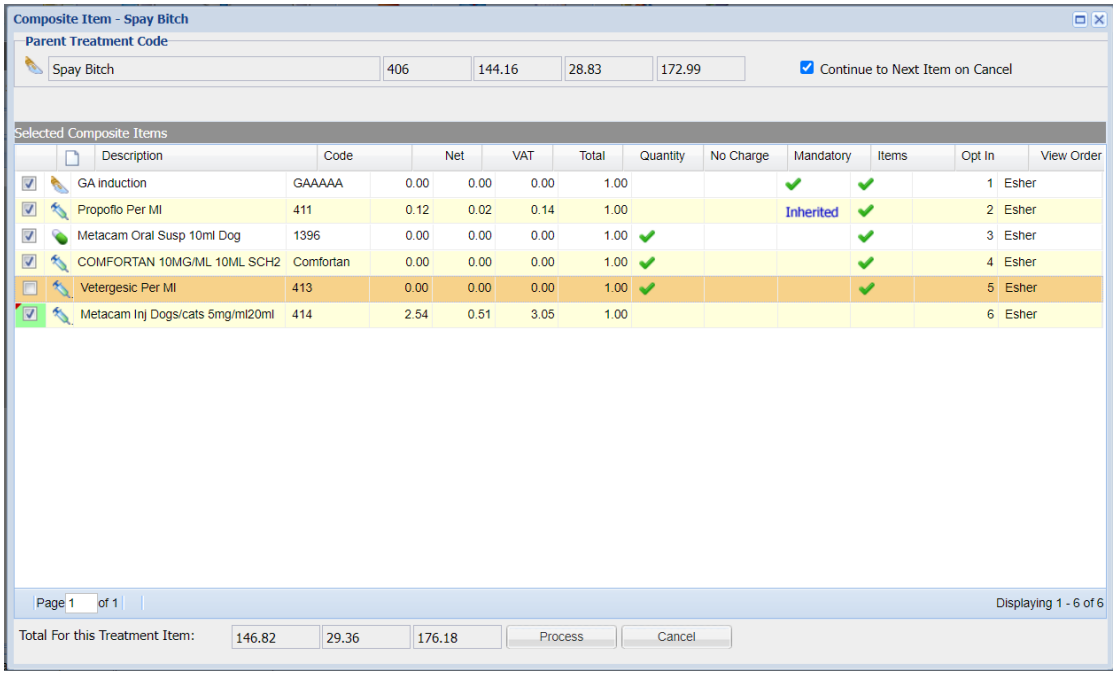

1. Navigate to the 'Add Treatment' screen (Treatment > Add Treatment tab).

2. Search for and select a composite item (Using the same method documented on the Adding a Treatment page).

Note: Composite Treatments can be easily identified as they show in bold.

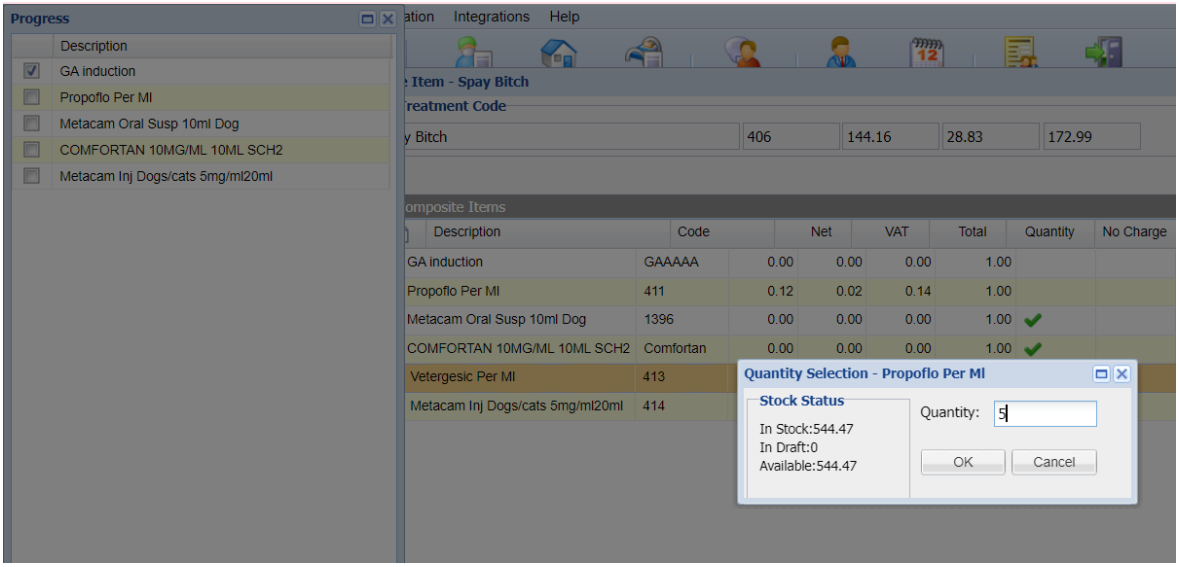

3. Once selected, a window will appear. The window shows the initial parent item at the top, followed by a panel underneath displaying a list of child items contained within the composite.

4. Select the items you wish to dispense using the check boxes on the left-hand column and select the 'Process' button to proceed.

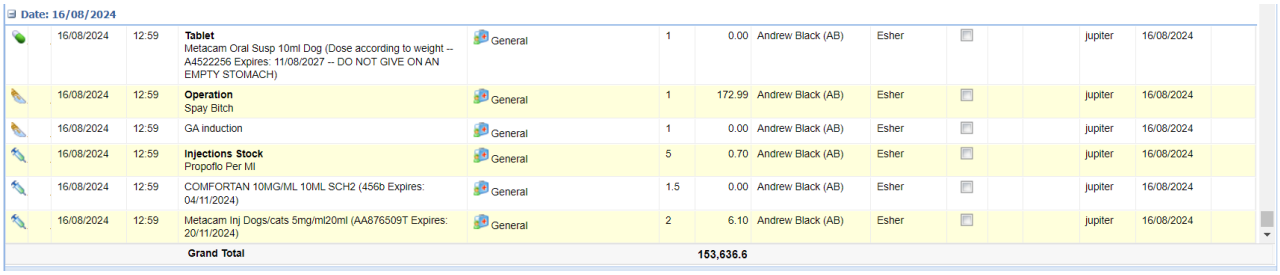

The system will process all items on the window, adding them to the patient's treatment draft. If labels, quantities or batch numbers are required, prompts will appear and you will be instructed to enter any required information.

Once an item has been added, a tick will be added to the progress window on the left hand side of the screen. This may just be quantity required or a label.

5. Once all items have been added, the parent item and child items will display in the add treatment screen.

6. Select 'Save' to save the treatment to the patient's Treatment History.
